

Machine Learning

Machine Learning is a branch of artificial intelligence that enables computers to learn patterns from data and make predictions or decisions.

The three common types of machine learning are supervised learning, unsupervised learning, and reinforcement learning.

Supervised learning uses labeled training data. Examples include linear regression, logistic regression, decision trees, random forests, and support vector machines.

Unsupervised learning works with unlabeled data. Clustering and dimensionality reduction are common examples.

Machine learning requires data preprocessing, feature engineering, model training, evaluation, and deployment.
