

Generative AI

Generative AI refers to artificial intelligence systems that can create new content such as text, images, audio, video, and code.

Large Language Models (LLMs) are generative AI models trained on large collections of text.

Retrieval-Augmented Generation (RAG) combines information retrieval with language generation. A retrieval system first finds relevant documents and then provides that information to a language model.

Vector databases and embedding models are commonly used in semantic search and RAG systems.

Generative AI is used for chatbots, coding assistants, content generation, document analysis, and question answering.
