

Natural Language Processing

Natural Language Processing (NLP) is a field of artificial intelligence that enables computers to understand, process, and generate human language.

Common NLP tasks include text classification, sentiment analysis, named entity recognition, machine translation, question answering, and summarization.

Tokenization divides text into smaller units called tokens.

Embeddings represent words, sentences, or documents as numerical vectors.

These vectors allow systems to compare semantic similarity between pieces of text.

Modern NLP systems frequently use transformer-based models.
